

Abstract

The aim of this sub-project is to develop an image processing component to support low-cost automated greenhouses. The image processing application must enable the greenhouse system to establish various aspects about the plants from the images taken. These aspects include plant health, plant growth and plant disease identification from the images of different parts of the plants in the greenhouse.

Fill out the introduction.

Fill out the plant phenotyping section [1].

Fill out the Image processing techniques section.

Fill out the applications in low cost greenhousing techniques secton.

Fill out the conclusion section.
